

Yihan Li

yihanli0829@gmail.com | 310-689-8174 | Los Angeles, CA 90024

Data Scientist focused on **risk decisioning**, payment-adjacent analytics, marketplace experimentation, and production-grade metric design. Experienced in SQL/Python analysis over large-scale event and transaction-level data, causal inference, backtesting, anomaly detection, scoring logic, and translating ambiguous risk signals into product, operations, and governance decisions.

PROFESSIONAL EXPERIENCE

Goldman Sachs

New York, NY

Quantitative Strategist

Nov 2025 - Present

- Design and own production **risk metrics** across transaction- and entity-level pricing/liquidity signals for **100+ global entities**, defining new diagnostic indicators for evolving business scenarios and analyzing **billions of records** to detect anomalies, quantify risk shifts, and trigger drill-down investigations.
- Build root-cause decomposition frameworks for abnormal movements in ratio-based risk indicators, separating pricing, funding, balance-sheet, and regional drivers from noisy market moves across multi-billion-record datasets and cross-region cohorts.
- Apply **difference-in-differences** and historical backtesting to evaluate policy and market changes, balancing missed-risk vs **false-positive** escalation costs and improving confidence in risk-control decisions before stakeholder review.
- Develop thresholding and investigation-prioritization logic for risk indicators, translating continuous signal movements into actionable review paths and post-rollout monitoring routines for senior stakeholders while reducing low-signal investigation noise.
- Build **AI-assisted analytical validation workflows** with source traceability, edge-case checks, explainability review, and human-in-the-loop controls, ensuring model-driven insights are auditable, reliable, and governance-ready in high-stakes contexts.

Blinkle AI (LLM-powered job marketplace)

New York, NY

Data Scientist (Part-time), Product

Sep 2025 - Jan 2026

- Designed the core **risk and quality metrics framework** for a two-sided job marketplace, defining north-star and diagnostic metrics across match quality, recommendation quality, suspicious behavior, and application conversion.
- Analyzed **millions of production user events** with SQL and Python to identify low-quality or suspicious behavior patterns that degraded matching quality, surfacing high-risk cohorts and downstream product friction points.
- Built **LLM-derived scoring features** from resume and job-description signals for screening/ranking pipelines, improving top-match accuracy by **37%** and creating structured decision signals for product and review workflows.
- Designed holdout and A/B experiments for screening and ranking interventions, quantifying false-match vs missed-match tradeoffs, precision-conversion-friction effects, and increasing application conversion by **41%**.

ARB Interactive

Miami, FL

Data Scientist Intern, Payments

Jun 2024 - Sep 2024

- Analyzed hundreds of millions of payment-adjacent interaction events from a **2.1M-user** live-streaming platform to detect abnormal traffic, creator abuse, and high-risk behavioral cohorts, supporting fraud/abuse proxy monitoring and traffic-control interventions.
- Developed a creator-level **causal impact framework** using counterfactual baselines and retention modeling to estimate incremental ROI of incentive and intervention policies, improving policy ROI by **18%**.
- Built behavioral segmentation models with **K-Means clustering** to identify heterogeneous response and risk patterns, enabling targeted interventions that increased DAU by **12%** while reducing broad, unnecessary user friction.
- Designed, analyzed, and monitored A/B-tested policy interventions after rollout, measuring impact on creator retention, content quality, platform health, and the tradeoff between abuse prevention and user experience.

EDUCATION

University of California, Los Angeles | Master of Quantitative Economics | Jul 2025

GPA: 4.00/4.00 | Coursework: Database Management, Machine Learning, Time Series Forecasting, Optimization Methods

Open For Good Project: Used Qualtrics surveys and RNN models to quantify sentiment in sustainability disclosures.

Nanjing University | Bachelor of Economics, Minor in Mathematics | Jul 2023

GPA: 3.93/4.00 | Coursework: Mathematical Statistics, Stochastic Processes, Regression Analysis, Statistical Computing

Honors: National Scholarship, Top 1%; First Place, Citi Group Fintech Competition.

TECHNICAL SKILLS

Risk & Analytics: Risk Metrics Design, Fraud/Abuse Monitoring, Risk Decisioning, Risk Scoring, Anomaly Detection, Backtesting, Thresholding, Root-Cause Analysis, Cohort Analysis, Segmentation, Experimentation, Causal Inference, Difference-in-Differences

Machine Learning: Regression, Classification, Tree-Based Models, XGBoost, Feature Engineering, Model Validation, Explainability, LLM Structured Signal Extraction

Tools: Python, SQL, R, Spark, Airflow, AWS, Tableau, Stata, NumPy, Pandas, Scikit-learn, Matplotlib, Seaborn
